### Features

**Size** 500 ml  
**Formulation** Soluble concentrate (liquid solution) containing 526 g/L of imidacloprid.  
**Coverage** Up to 555 m<sup>2</sup> (5 900 sq.ft) for a full container

- For the control of lesser mealworm in poultry facilities.
- Can be used as a broadcast, band, spot or crack and crevice treatment to floors, walls, and support beams of poultry facilities.
- Designed for integrated pest management programs. Rotation between different classes of chemicals can delay the development of resistance. To be used in rotation with the Debantic 50 WP and the Tempo 20 WP.

### Why control darkling beetles ?

- If left unchecked, beetles infest poultry houses, running up into the walls during cleanout (between flocks) and back onto the floor when new chicks are put into the barn.
- Beetles destroy poultry barn insulation, eat poultry feed and carry diseases. Beetles can be eaten by chickens, spreading disease and causing stomach (or crop) impaction in chicks.

### Application

- If necessary, the entire poultry house can be treated as a broadcast spray. Alternatively, band or spot-treatment can be performed by applying diluted Credo SC Insecticide to a 1-m wide band under feed or water areas and/or adjacent to the side and end walls, along with the lower section of the walls, including 0.3 m up onto wood surfaces above the foundation, around posts and into cracks or crevices.
- Best used following clean-out when no poultry are present. Take care to avoid feed or water. People and poultry should not return to the treated facility until the Credo application has dried.

Protective equipment must be worn as when handling any pesticide.
